## **Aerogel Insulation Ideal for Slim Solar Panels**

Challenges	<ul> <li>Collector pipes insulation for new solar thermal panel developed by Solar Century.</li> <li>The panel was required to be super slim (25 mm) to replace existing roofing tiles.</li> <li>This meant the insulation needed to be about 9 mm. (Typical panels use 50 mm of mineral wool.)</li> <li>The temperature range at the collector pipes is 65°–200°C (149°–392°F) depending on operation cycle.</li> </ul>
Aerogel Solution	<ul> <li>Aspen Aerogels designed a solution of 9 mm of flexible, durable Spaceloft™ 9251, which meets the thermal performance of 50 mm of mineral wool.</li> <li>The parts are water jet cut by Polyformes and installed by Solar Century.</li> </ul>
Benefits	<ul> <li>The aerogel solution provided the required thermal performance while minimizing insulation thickness, meeting the key criteria.</li> <li>The very low conductive heat generated savings over conventional insulating materials during night hours.</li> <li>Spaceloft<sup>™</sup> 9251 generates no negative VOCs through the operating temperature range of 65°–200°C (149°–392°F).</li> </ul>

Absorber Plate Temperature: 65°C (149°F)

Heat loss through 9 mm **Spaceloft™ 9251** 56 W/m<sup>2</sup> = 7.4% of Solar Heating Load

Heat loss through 50 mm of Mineral Fibre 31 W/m<sup>2</sup> = 4.1% of Solar Heating Load
